

Egyptian Ancient Relics

Introduction

Thank you very much for buying **Egyptian Ancient Relics**. This pack was created from scratch collecting references and reworking photoscanned high-poly models and raw textures from real world objects. The following will explain the main features and tips to get the most out of it.

Introduction

1: First steps

IMPORTANT: Compatibility

If HDRP / URP doesn't work and common mistakes

2: Demo Scenes

PrefabsViewer

Showcase

3: Third-Party Assets

Post Processing Stack v3 Profiles

4: Working with LODs

Editing Prefabs with LODs

5: Prefabs

6: Contact

7: Special Thanks

1: First steps

Download and Import: Just go to **Windows -> Package Manager -> Egyptian Ancient Relics** or import directly from the [Asset Store](#).

IMPORTANT: Compatibility

This asset is fully compatible with [Built-in Render Pipeline](#), [Universal Render Pipeline](#) and [High Definition Render Pipeline](#). But only on the **LTS** more stable versions so **we don't guarantee that will work on alpha or beta versions**.

This asset contains **.unitypackages** files with **pre-configured** content (materials, post processing profiles, demo scenes, etc) for some of common LTS and API versions.

If HDRP / URP doesn't work and common mistakes

Be sure to download the **correct supported SRP Version**. Be sure you've downloaded all the **SRP dependency files** from the [Package Manager](#).

2: Demo Scenes

You can try the different scenes that are included in this pack to have a reference of how they can be used to generate different atmospheres in different scenarios.

Note: To be able to appreciate them better in the standard render pipeline, you must have [Post Processing Stack V3](#) installed (see more details in the [Third Party Assets section](#)).

PrefabsViewer

In **Prefabs Viewer** a **grid prefabs** are shown. A more practical way to take a look at the whole pack or choose your favs, the lighting is very simple..

Showcase

This scene is designed to render cinematics, the lighting simulates something more similar to a **warmy sunny day in the desert**.

3: Third-Party Assets

This pack includes some **presets** that can be used with other assets available in the Unity Assets Store. to use them it is **necessary to have previously installed versions compatible with these presets**. (We are working on new presets for other assets for purposes that will be included in future releases).

Post Processing Stack v3 Profiles

Post-processing profiles contain the touch-up seen in the sample scenes, it is necessary to have **Post Processing Stack v3** installed from **Windows -> Package Manager** to maximize its compatibility.

4: Working with LODs

The prefabs in Egyptian Ancient Relics make use of the **Unity LODs System**, these are pre-configured to work with a **LOD Bias: 2** and **Maximum LOD Level: 0**. You can edit these configuration settings in **Project Settings -> Quality -> Others**.

Editing Prefabs with LODs

In certain cases and depending on the configuration of each project, it may be necessary to edit the LODs of the prefabs, you can access this option from the "**LOD Group**" component located in each prefab. In turn to access the models you can go to the folder **AE Alexander Elert -> Egyptian Ancient Relics -> Meshes**.

5: Prefabs

The Prefabs are located in the **AE Alexander Elert -> Egyptian Ancient Relics -> Prefabs**.

6: Contact

Thank you for reading this documentation. If you find some errors, suggestions you can contact me at: alexanderelert@outlook.com
